Assignment 1017 Feedback

Anthony B. Menjivar   *TonyMenji*

3a — Your work shows some degree of knowledge at creating user interfaces, but all told the range is comparatively narrow because a lot of your code is simply copied. The code demonstrates a single dynamic behavior, which is the opening and closing of modals. Not much else going on here unfortunately. (**/**)

3c — You mostly respect the MVC paradigm except in those character headings, where you use the obsolete `font` tag. Unfortunately this one violation suggests that you might not fully understand this concept, or else you would not have used this tag at all (or else would have asked me about whether it would be OK to use it). (**/**)

4a — Your code is mostly correct but narrow in functionality, its size inflated by repetitive blocks that don't add a lot to the overall mockup page. Further, no help functionality was seen, and this was explicitly requested by the assignment. There are a few other technical issues, and these are indicated in the inline comments so make sure to read them. Finally, the little CSS that you do have in the *rpg.css* file is actually disrupted by leftover *git* conflict markings: these should be cleaned up. (**/**)

4b — As mentioned in *3c*, there is a distinct violation of separation of concerns in the use of the `font` element. Although this is the sole violation (albeit committed 3 times), its very presence hints that you might not have been clear on the role that CSS plays in modern web standards. Custom font family and color is an ideal opportunity to demonstrate proper separation of concerns, but unfortunately this opportunity was missed. (**/**)

4c — Your code is largely understandable, but is occasionally prone to an indentation hiccup (see inline comments). Also, your editor looks like it is mixing spaces and tabs; double-check its settings to stay with all-spaces. (**|**)

4d — Your work shows some resource and documentation use, but ultimately for a very narrow set of functionalities. In addition, choice of documentation is questionable based on your use of the `font` tag. Ultimately, I think you could have done a little more searching and reading to add more variety and customization to your RPG web pages. (**/**)

4e — You committed a single time for this assignment, and your message was a very generic "RPG Files"—your version control habits definitely need work. To top it off, your commits included conflict notes added by *git*. I actually won't count this too much against you, but when something like this happens, you should ask for help so that I can show you how to clean things up. (**/**)

4f — Largely submitted to GitHub on time, although aforementioned conflict additions from *git* do show up on the page. *my.cs.lmu.edu* site also live at time of grading, but files were not located at the specified path (missing a *cmsi370* folder). (**|**)
